

Coffee Brewing Guide

Chapter 1: Equipment

You will need a kettle, a scale, a grinder, and a pour-over dripper.

A gooseneck kettle gives you the most control over water flow.

Chapter 2: Water Temperature

The ideal water temperature for brewing coffee preserves flavor and prevents bitterness. Use water between 195 and 205 degrees Fahrenheit, just off a rolling boil.

Chapter 3: Ratio

A standard ratio is 1 gram of coffee to 16 grams of water.

Adjust to taste from there.
